

# Vulnerability Assessment Report

## Project Information

Project Title: Vulnerability Assessment of Agenttrust Limited Web Infrastructure

Prepared By: Umar Pharooqq

Date: July 12, 2026

## Executive Summary

A vulnerability assessment was conducted on the web infrastructure of Agenttrust Limited to identify security weaknesses that could expose organizational assets to cyber threats. The assessment focused on publicly accessible systems, web applications, and server configurations.

The assessment identified several vulnerabilities with varying levels of risk. One critical vulnerability, two high-risk vulnerabilities, and several medium-risk issues were discovered. If exploited, these vulnerabilities could result in unauthorized access, data breaches, service disruption, and reputational damage.

Immediate remediation of critical and high-risk findings is strongly recommended.

## Assessment Scope

- Web Server – Public-facing company website
- Application Server – Hosts internal business applications
- Employee Portal – Authentication and employee access system
- Database Server – Customer and business data storage

## Assessment Methodology

1. Asset Identification
2. Vulnerability Discovery
3. Risk Analysis
4. Vulnerability Prioritization
5. Remediation Recommendations

Risk ratings: Critical, High, Medium, Low.

## Vulnerability Findings

### Finding 1: Outdated Web Server Software

Risk Level: Critical

Impact: An attacker may exploit known vulnerabilities to gain unauthorized access or execute malicious code on the server.

Likelihood: High

Recommendation: Upgrade software, implement patch management, and conduct monthly scans.

### Finding 2: Weak Password Policy

Risk Level: High

Impact: Attackers may conduct brute-force or credential-stuffing attacks.

Likelihood: High

Recommendation: Enforce 12-character passwords, complexity requirements, and MFA.

### Finding 3: Missing Security Headers

Risk Level: Medium

Impact: Increased exposure to browser-based attacks.

Likelihood: Medium

Recommendation: Implement CSP, X-Frame-Options, X-Content-Type-Options, and HSTS.

### Finding 4: Excessive User Privileges

Risk Level: High

Impact: Compromised accounts could lead to unauthorized changes or data access.

Likelihood: Medium

Recommendation: Apply least privilege, review access quarterly, and remove unnecessary admin rights.

### **Risk Summary**

Critical: 1

High: 2

Medium: 1

Low: 0

### **Remediation Priority**

Immediate (0–30 Days): Upgrade outdated software; strengthen password policies.

Short-Term (30–60 Days): Remove excessive privileges; review user access controls.

Medium-Term (60–90 Days): Implement security headers; conduct follow-up assessments.

### **Conclusion**

The assessment identified several vulnerabilities that require remediation to reduce organizational risk. Addressing the critical and high-risk findings should be prioritized to improve the overall security posture of Agenttrust Limited. Continuous vulnerability management, regular patching, and periodic security assessments are recommended.
